

I just learned yesterday the sad news of the death of Héctor de Vega on Sunday 10 at the age of sixty-six last May 10.

Héctor was my classmate during the 5 years of studies in La Plata University. We then worked together towards our PhD in Physics and we both had our first post-doc position at the École Normale Supérieure, in 1974. Héctor decided to stay in Paris and in 1980 he obtained a CNRS research position to work in Paris 6 University. After his retirement he was appointed *Directeur de recherche émérite au CNRS*.

In Argentina we started working in scattering problems and then on dimensional regularization (under the supervision of Bollini and Giambiagi) and then in Paris we worked together in soliton physics. Already settled in Paris 6 Héctor became interested in integrable models making very important contributions. In the last 20 years he still start a new line of research in astrophysics. The last of his 284 papers (*Galaxy phase-space density data exclude Bose-Einstein condensate Axion Dark Matter*) appeared in the arXives in January 2014.

Among my more than 100 co-authors Héctor was the one who taught me more.

Waiting with Hector (left end) for the Analysis course (1967)
